

Overview:

We support goal 6 which is clean water and sanitation. In this project, we're aiming to raise awareness to children about reducing the use of water, recycling the trash instead of throwing it in seas

Team members and teachers working on the project

and rivers, and reducing the amount of water used in watering plants, washing cars, and showering.

In Egypt, polluted water is common in many water bodies, which causes diseases to spread rapidly and more than 46% of the population suffer from kidney diseases and virus C. This is why we are working our best to reduce these diseases.

Therefore, we are organizing campaigns for children, whom their ages are between 4 and 16 years, to help them understand the importance of water and the harmful effects of polluted water.

Our journey:

In the beginning, we thought of teaching the children about saving water, so we had an idea of teaching them by awareness campaigns. We thought how we could share the idea with children through a simple puppet show.

In our school, we started by entering KG and elementary classes to present the puppet show. We succeeded in sharing the awareness between

planting

children as we asked them after the show to answer some simple questions and they replied correctly. Then, we started making posters and spreading them across the school. We gained more recognition and people started to spread the idea.

During our process in spreading awareness, we planted vegetables using

gardener.

less water than usual and it grew as healthy as using excess of water. Also, we interviewed the gardener and we knew that he uses a lot of water, so we advised him to use less water.

THE NEXT CHAPTER:

We are aiming to reduce the usage of water by doing more campaigns for different ages to help them recognize how important water is to us and all living things. We are also trying to help reduce the polluted water by spreading awareness through these campaigns and workshops.
